## INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/IB2004/000563

The following documents are referred to in this report:

D1= US-A-4 196 368

D2= DE-A-198 45 423

D3= GB-A-2 032 173

### Re item V:

#### 1. Novelty:

None of the documents of the search report discloses an emitter or a method of manufacturing an emitter as defined in present claims 1 and 23. The subject-matter of claims 1 and 23, and of the claims dependent thereon, meets the requirements of Article 33.3 PCT.

#### 2. Inventive step:

The invention as defined in present claims 1 and 23 is characterized by a microstructured incandescent emitter with an oxide coating which is operative to preserve the profile of the microstructure at operating temperatures exceeding the melting point of the emitter

Microstructured incandescent light emitters are known from D1 and D2. It appears further to be obvious reduce evaporation of the emitter material by coating the surface of the emitter with a refractory oxide layer, see D3.

However, it is not apparent from D3 that the disclosed oxide layers are also suitable to preserve the profile of the microstructure in case of deformation or change of state of the material caused by the use of the emitter at temperatures exceeding the melting point of the emitter material.

This effect can be obtained, according to the present application, for example, by the provision of small cavities in the oxide layer which can absorb the volume expansion of the molten material (see present application, page 17, lines 14-33; figure 11).

This has the additional effect that very low melting point materials such as gold may be advantageously used as emitter material (see present application, page XXX).

D3, however, does not indicate, explicitly or implicitly, any features which would help to produce the effects as discussed above.

International application No.

PCT/IB2004/000563

The subject-matter of claims 1 and 23, both of which contain the same concept of an oxide coating which is suitable for preserving the shape of the emitter at operating temperatures higher than the melting point of the emitter material, meets therefore the requirements of Article 33.3 PCT. The same applies with respect to the dependent claims.

3. Industrial applicability is obvious (Article 33.4 PCT).
